

the model's $p(y_t | y_{<t}, \mathbf{x})$ on each branch; the running $\log p$ at each leaf

- greedy: 4 6 1 7 6 4 6 6 3 $\langle /s \rangle$, $\log p = -2.54$ (wrong)
- beam, $k=2$: 4 6 1 7 6 2 6 5 3 $\langle /s \rangle$, $\log p = -1.68$ (the reversal)
